

Cranial duramater and dural venous sinuses

Introduction

- cranial cavity contains : brain ,blood, CSF
- Brain is covered from outside to inside by:
- Three meninges or membranes-
 - 1.Dura mater : thick : pachymeninx
 - 2.arachnoid mater: spider web
 - 3.Pia mater: thin transparent vascular
- Arachnoid + pia = leptomeninx

Cranial dura

-*2 layers* : outer endosteal
 : inner meningeal

-*4 folds* : falx cerebri
 falx cerebelli
 tentorium cerebelli
 diaphragma sellae

-*Dural venous sinuses* are lodged along the lines of separation between the endosteal and meningeal layers

Spinal dura

- consists of meningeal layer only
- epidural (extradural) space : +nt
dural venous sinuses : -nt

Dural folds/processes/reflections

- I. Falx cerebri
- II. Falx cerebelli
- III. Tentorium cerebelli
- IV. Diaphragma sellae

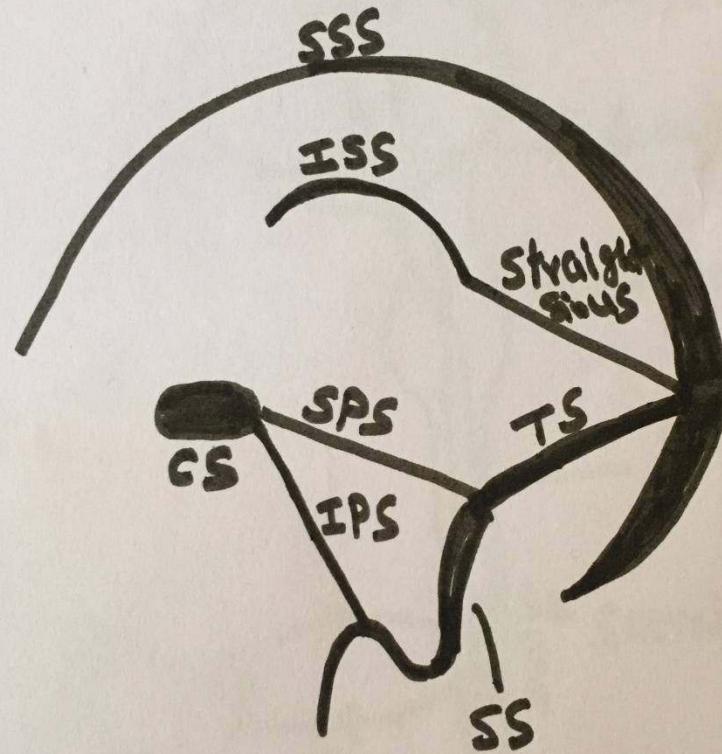

Characteristics of Dural venous sinuses

- lined with endothelium
- valve less
- devoid of muscular coat
- collect blood from
brain, meninges, orbit, scalp, nose....
- absorb the C.S.F through the granulation tissue
- receive valve less emissary veins

Venous sinuses of duramater

- Situation : between endosteal and meningeal layers
- Classification:-paired:
 - 1)transverse
 - 2)sigmoid
 - 3)cavernous
 - 4)superior and inferior petrosal
 - 5)spheno-parietal
 - 6)petro-squamous

Dural venous sinuses

Unpaired sinuses

- superior sagittal
- inferior sagittal
- anterior intercavernous
- posterior intercavernous
- occipital
- straight
- basilar venous plexus

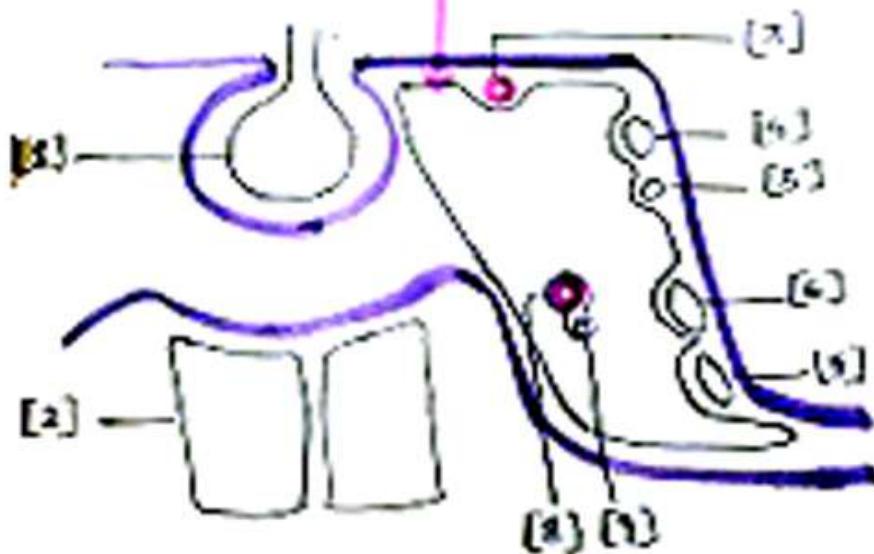

Applied anatomy

- pain sensitive
- dural origin of headache
- head injury and intracranial haemorrhage
- leptomeningitis : infection of leptomeninx
- tentorial herniation :
- bulging of the sellar diaphragm
- cranial dura Vs spinal dura

Cavernous sinus

- Situation* : on each side of the body of sphenoid bone
- *Extent* :
- *measurement* : -length-2 cm
 - breadth-1 cm
- *formation* : -roof and lateral wall
 - floor and medial wall
- *structures passing through the sinus*:

Cavernous Sinus.

- 1 - Hypophysis cerebri.
- 2 - Sphenoidal air sinus.
- 3 - Internal carotid artery
- 4 - III^{rd} cranial nerve.
- 5 - IV^{th} cranial nerve
- 6 } V^{th} cranial nerve divisions.
- 7 }
- 8 - ICA
- 9 - VI^{th} cranial nerve

External relations of cavernous sinus:

-medially and below :

hypophysis cerebri and sphenoidal air sinus

-laterally : trigeminal cave , uncus of temporal lobe

-above : optic chiasma , carotid siphon

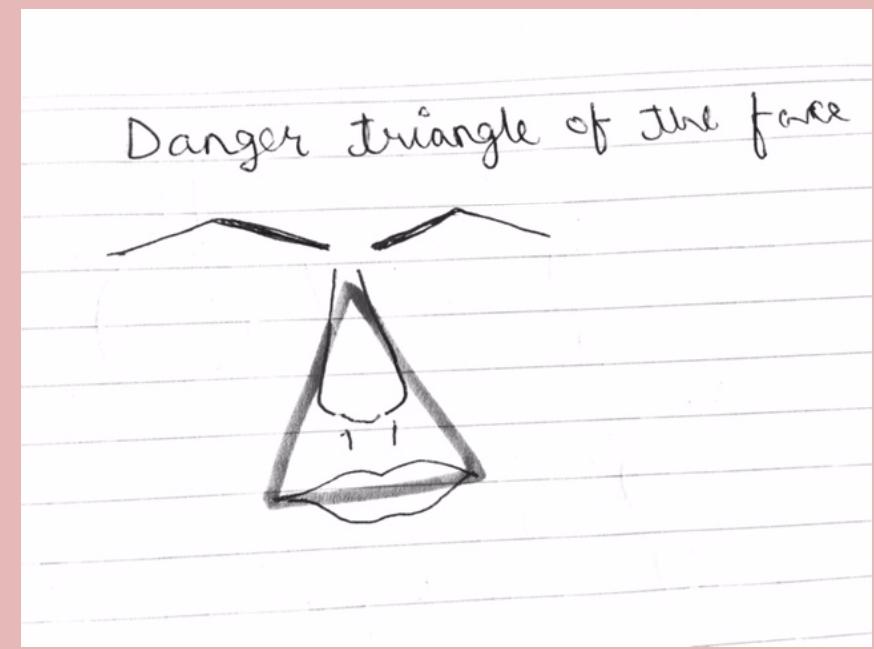

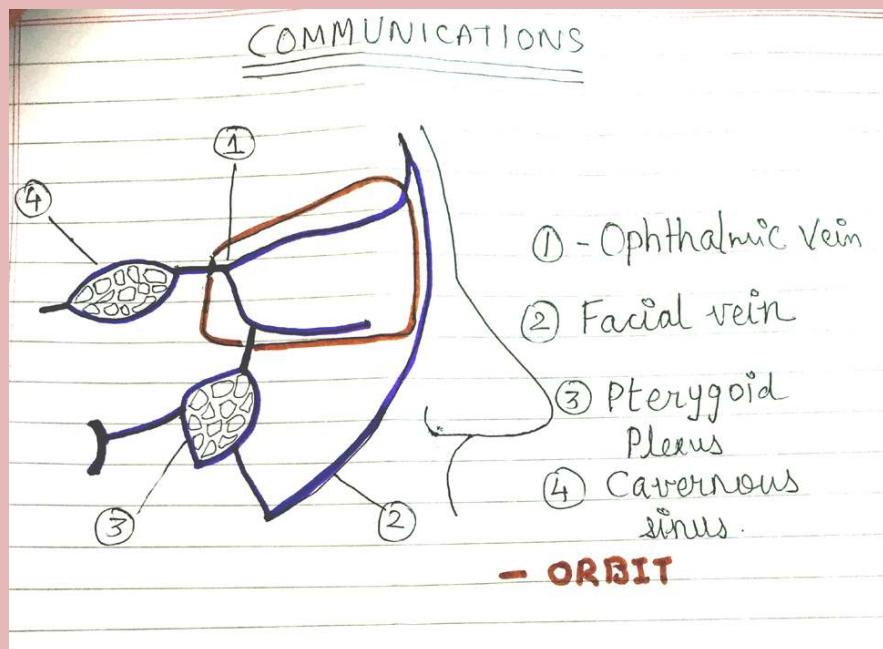

Factors regulating blood flow through cavernous sinus

- Carotid pulsations
- Gravity
- Change of position of head

TRIBUTARIES:

- *SUPERIOR OPHTHALMIC VEIN*
- *INFERIOR OPHTHALMIC VEIN*
- *CENTRAL VEIN OF RETINA*
- *SUPERFICIAL MIDDLE CEREBRAL VEIN*
- *FEW OF INFERIOR CEREBRAL VEINS*
- *SPHENO-PARIETAL SINUS*

communications

applied anatomy:

- 1) **septic thrombosis**:-severe pain in eye and forehead;ophthalmoplegia;marked oedema of eyelids with exophthalmous;unilateral may become bilateral

- 2) **pulsating exophthalmos**:arteriovenous communication between ICA and cavernous sinus due to fracture of base of skull

- 3) **metastasis of tumor cells** to the Dural sinuses:
from thorax,abdomen,pelvis because.....
