LASIC CELLS , JUXTA GLOMERULAR CELLS

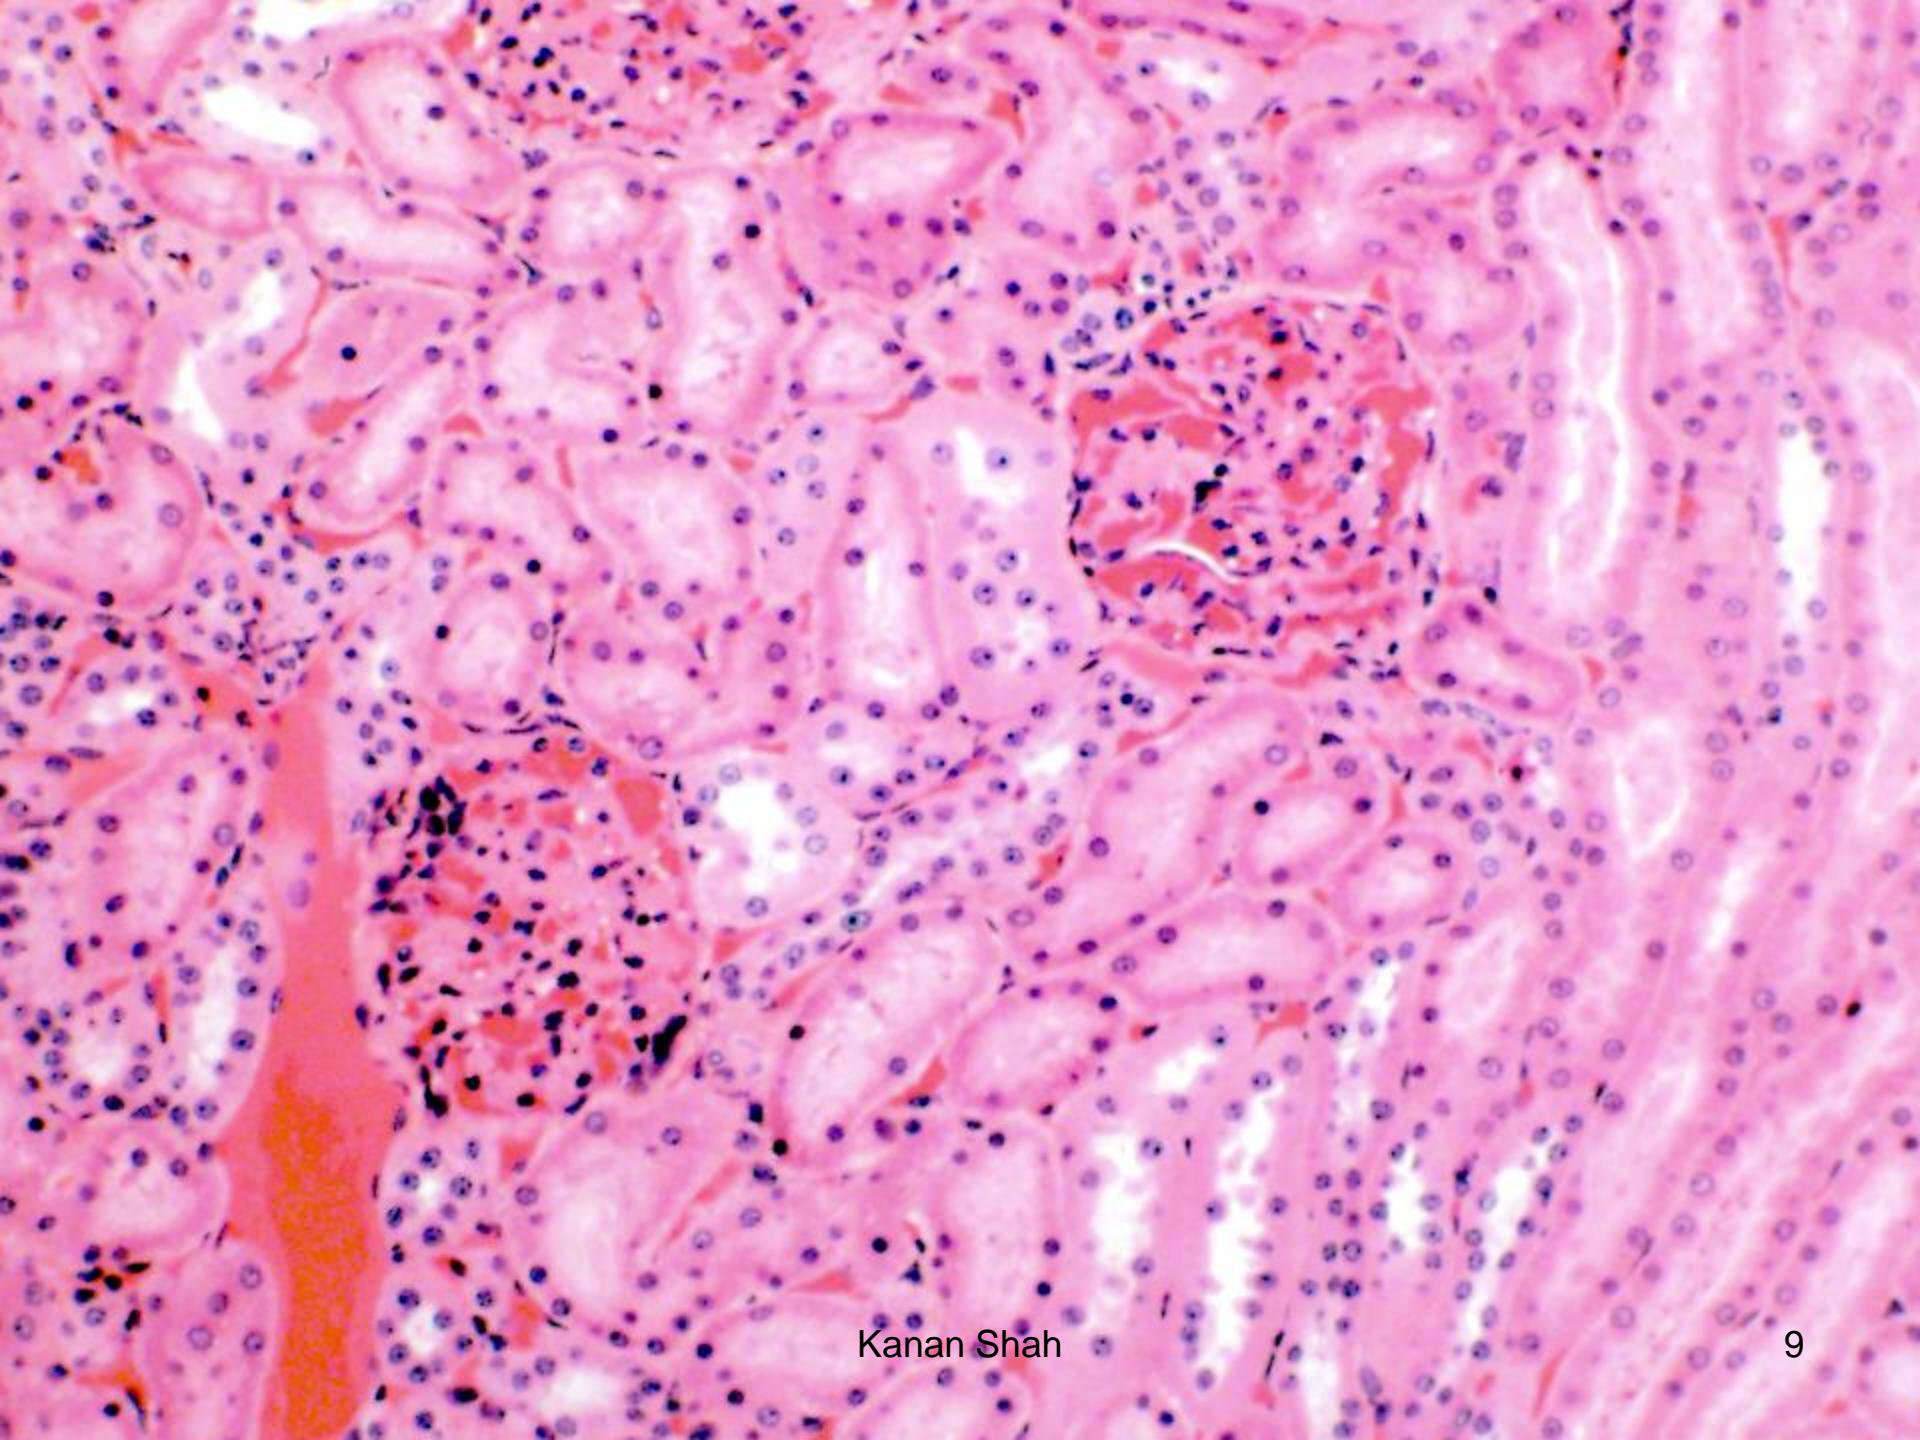

## The Juxtaglomerular Apparatus: Source of Renin

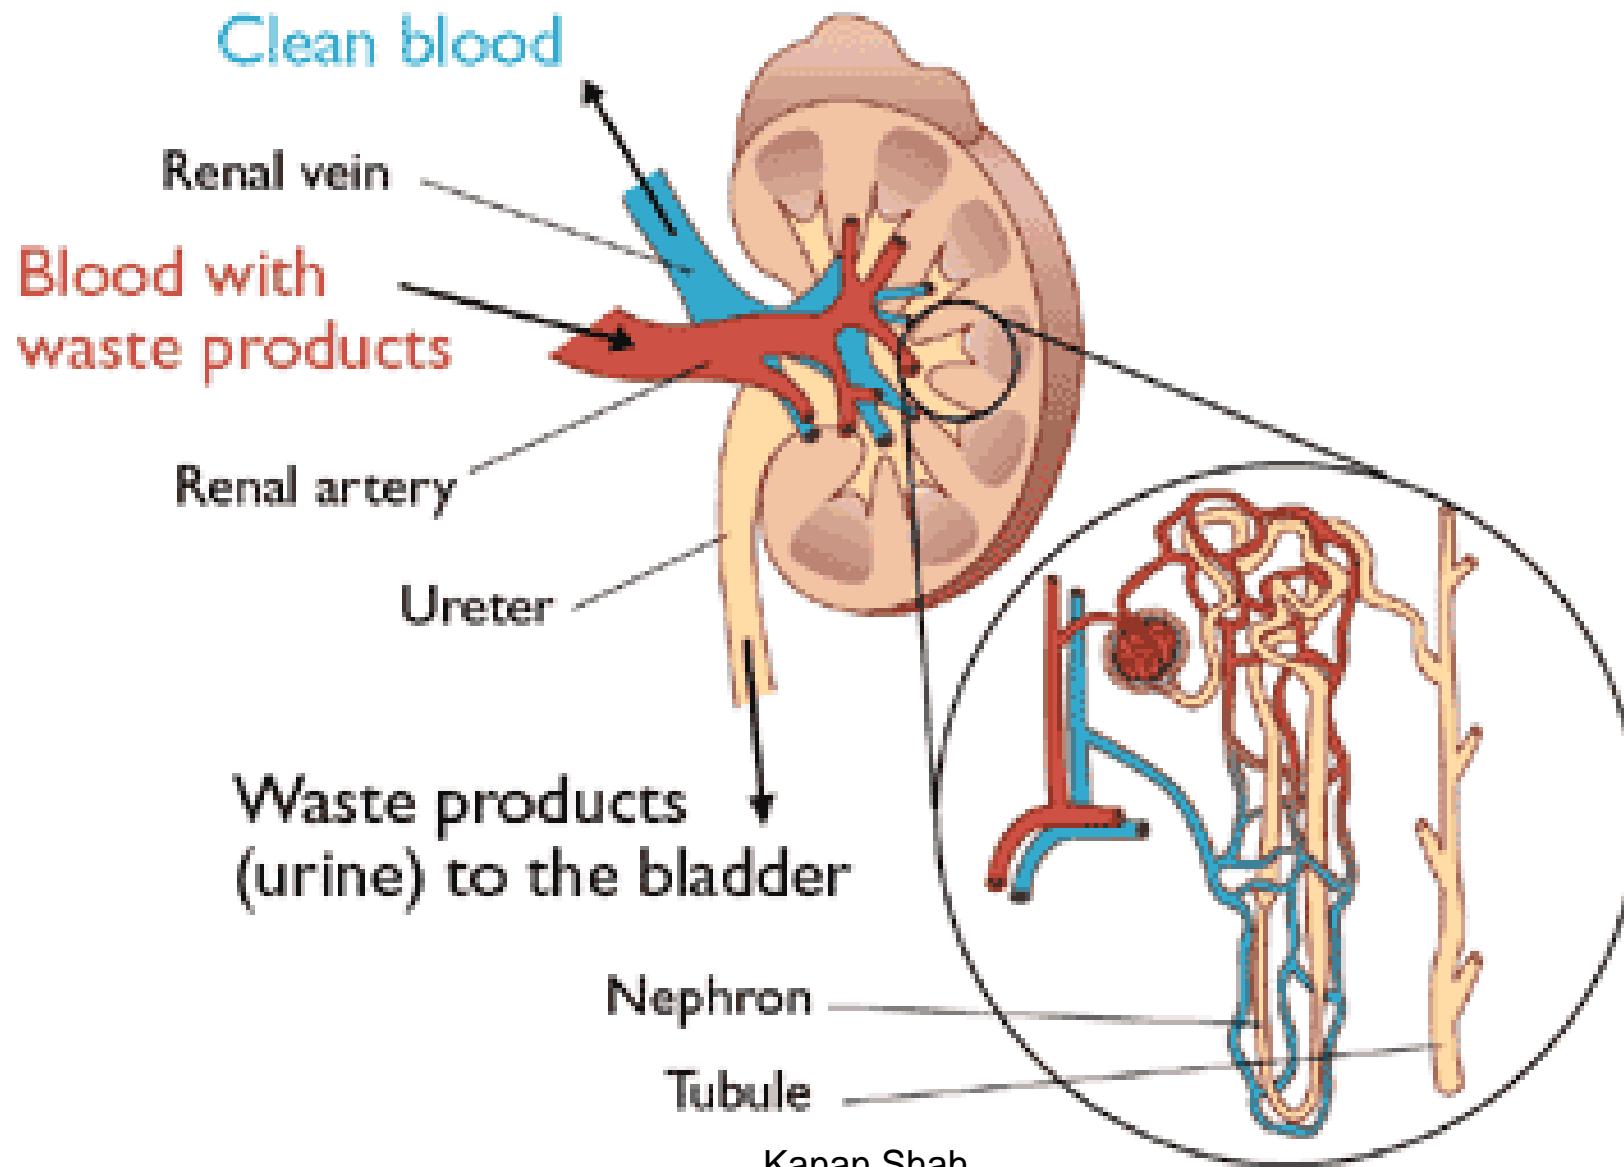

Left modified from Figure 47-4, p786, in Robert M. Berne & Matthew N. Levy, *Physiology*, 2<sup>nd</sup> Ed., C.V. Mosby Co.: St. Louis, MO, 1988; right modified from Figure 15.9, p373, in Mac E. Hadley, *Endocrinology*, 5<sup>th</sup> Ed., Prentice Hall: Upper Saddle River, NJ, 2000.

Kanan Shah

# How the kidney works

# Proximal convoluted tubule

- 60 um in diameter
- Single layer of truncated columnar epithelium rest on basement membrane. acidophilic cytoplasm , nucleus basal in position , brush border
- Functions – active reabsorption of glucose, amino acids , sodium , calcium , chloride , phosphate and bicarbonate back to blood. Obligatory reabsorption of water.

# Loop of henle

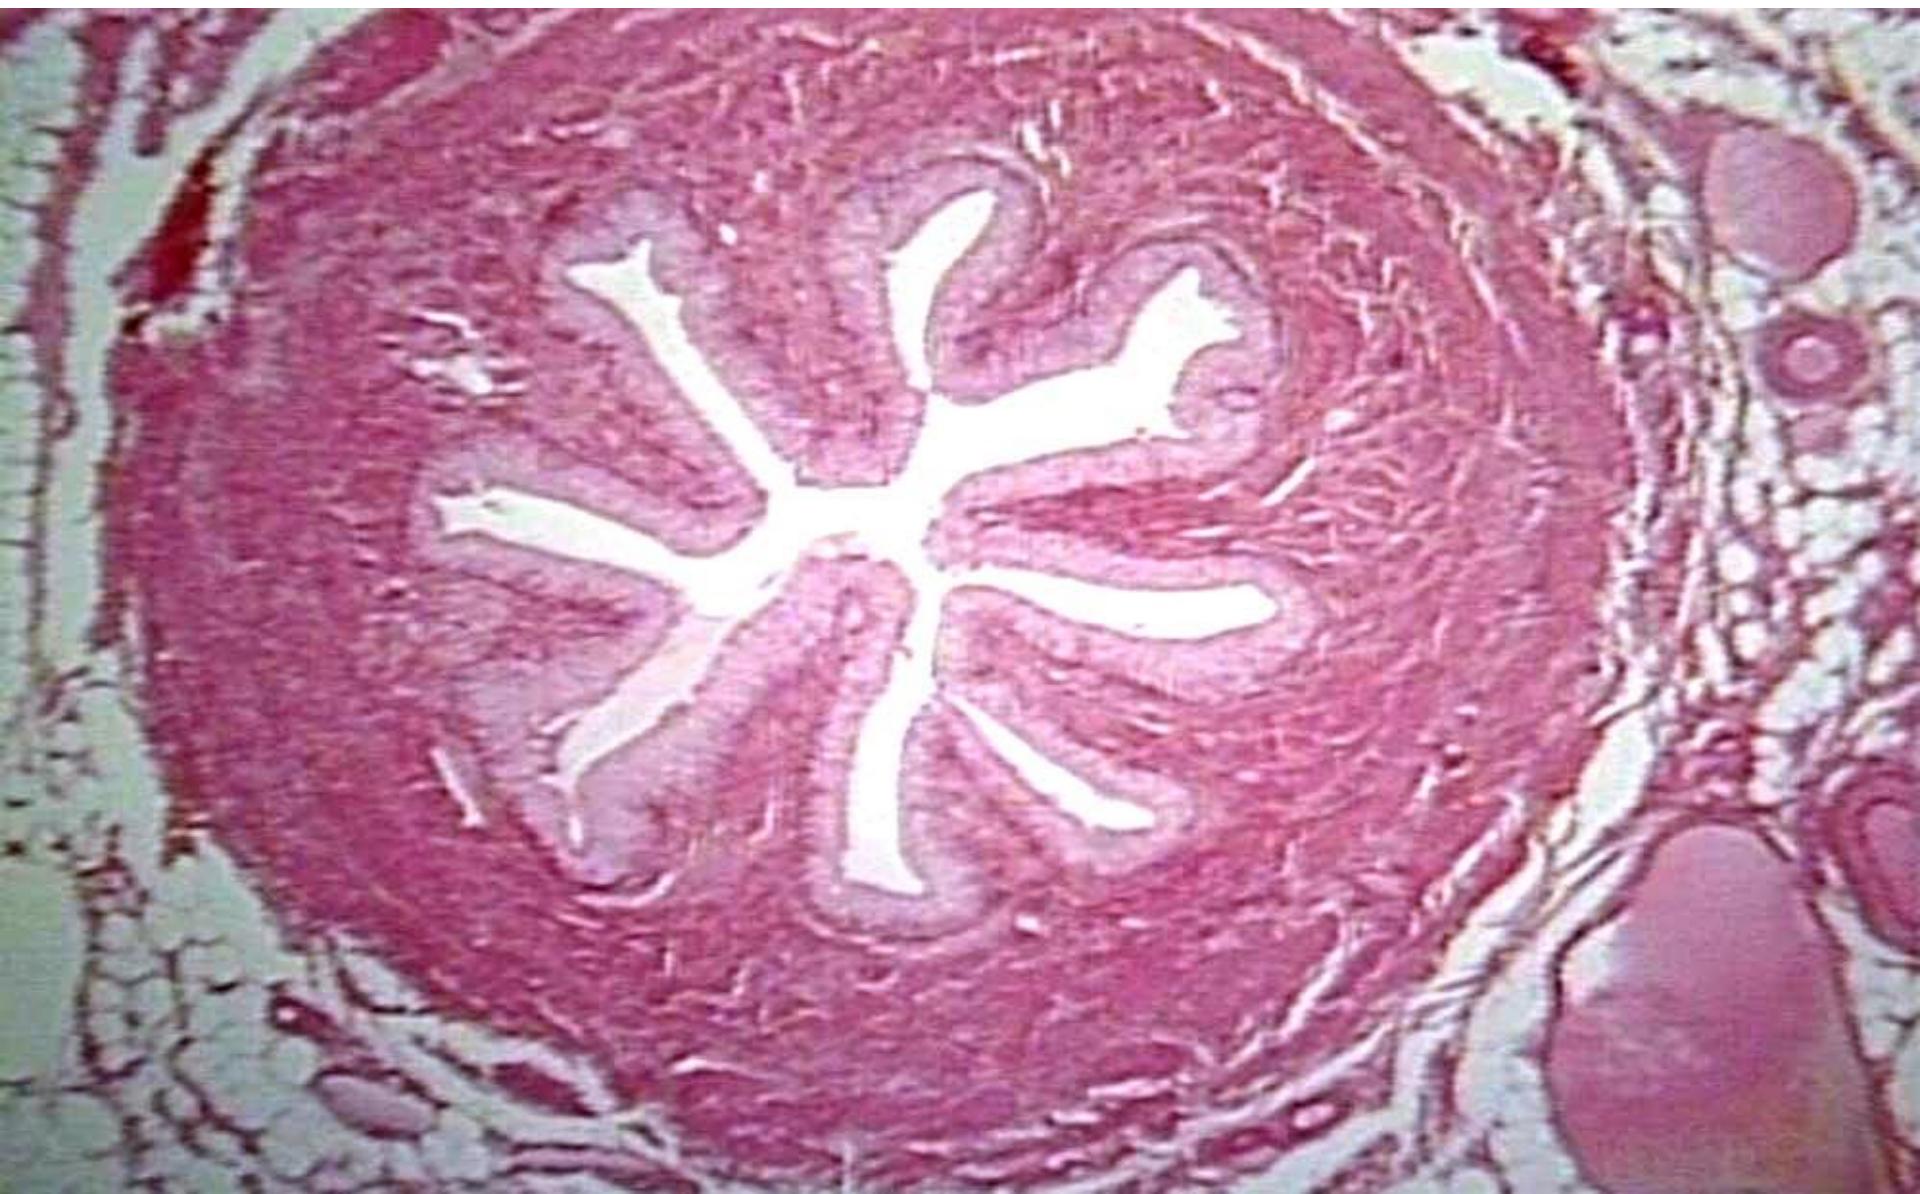

- Functions : ascending limb pump out chloride ion.  
descending limb diffuses water out.  
Maintain graded osmolarity of interstitial fluid  
of pyramid

# DISTAL CONVOLUTED TUBULE

- 30 um in diameter.
- Lined by cuboidal epithelium.
- Basophilic cytoplasm, devoid of brush border.
- Functions : Active absorption of water.

# URETERS

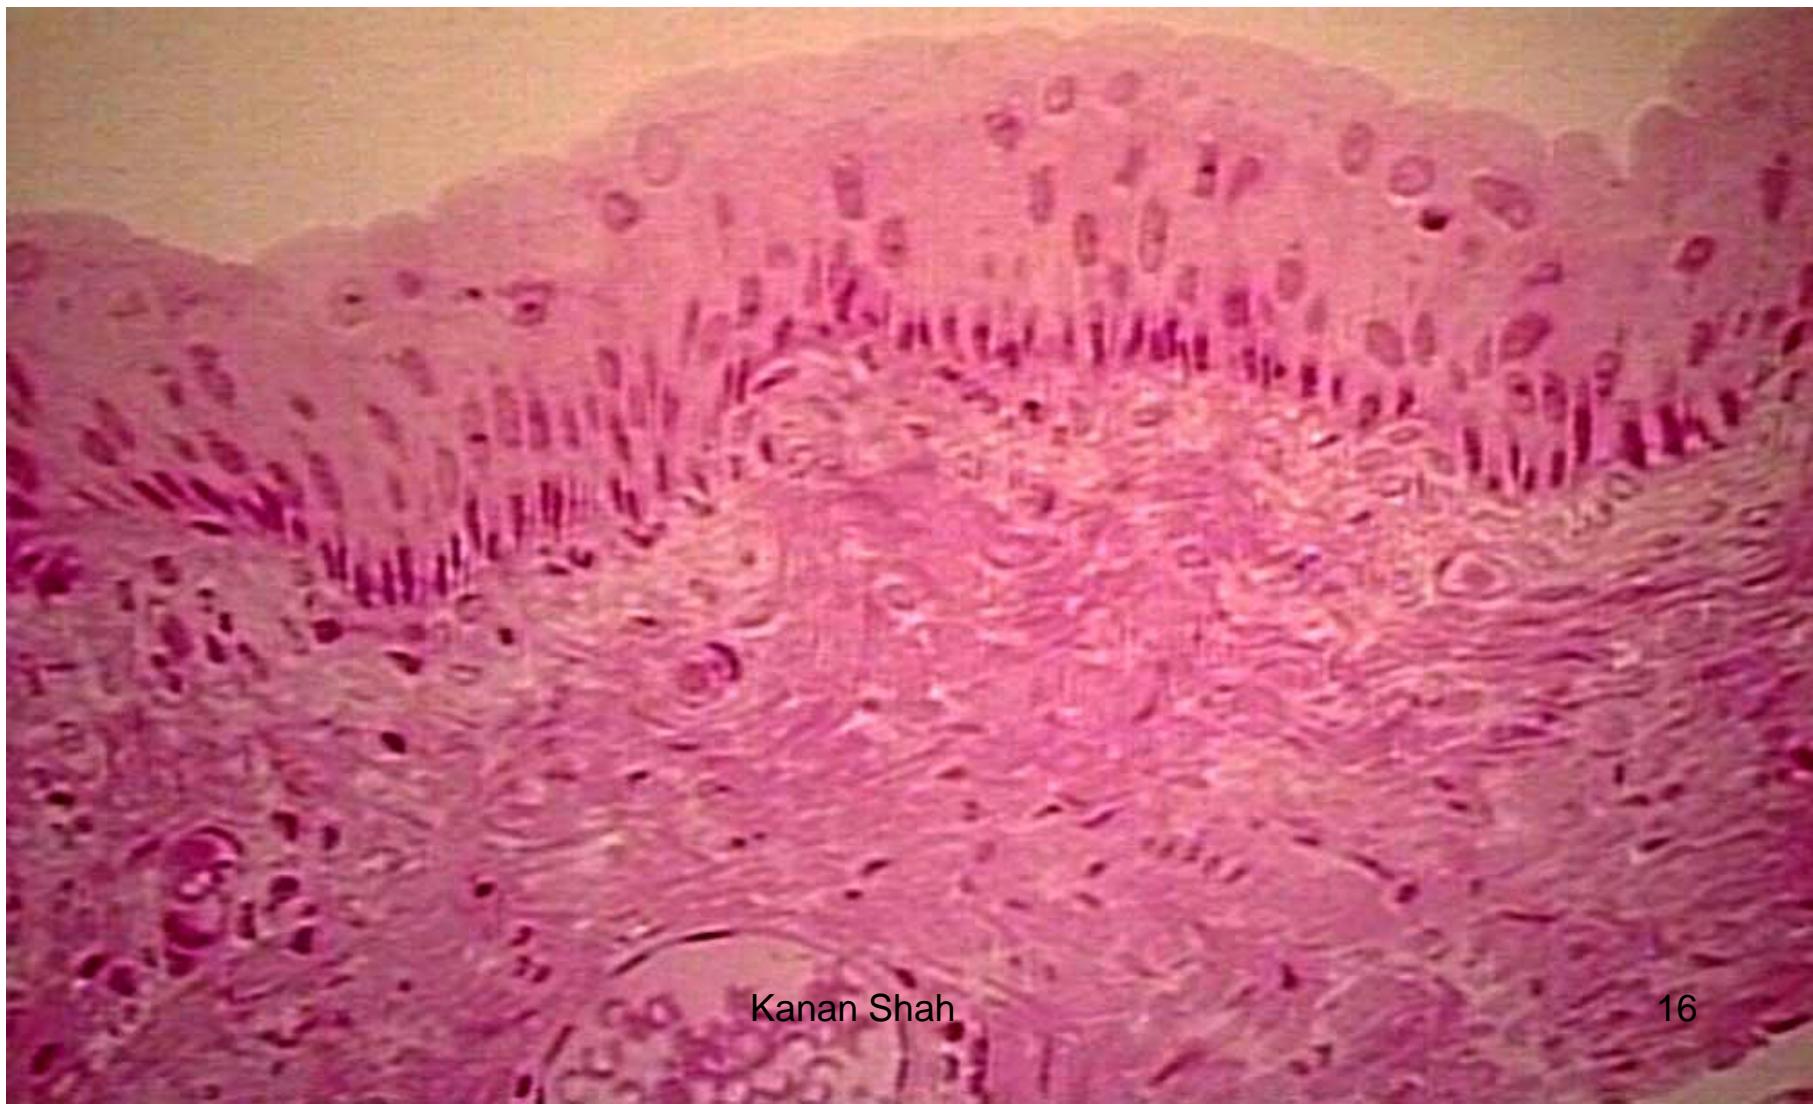

- THREE COATS :
- OUTER FIBROUS -elastic fibers in loose connective tissue , blood vessels, nerves , lymphatics and fat cells
- MIDDLE MUSCULAR - In upper two thirds muscles arranged in two layers outer circular and inner longitudinal , In lower one third in three layers outer longitudinal middle circular and inner longitudinal
- INNER MCOUS MEMBRANE –  
Transitional epithelium . Thrown into six longitudinal folds when ureter is empty.

Kanan Shah

# Urinary bladder

- Four coats - serous , muscular , submucous , mucous.

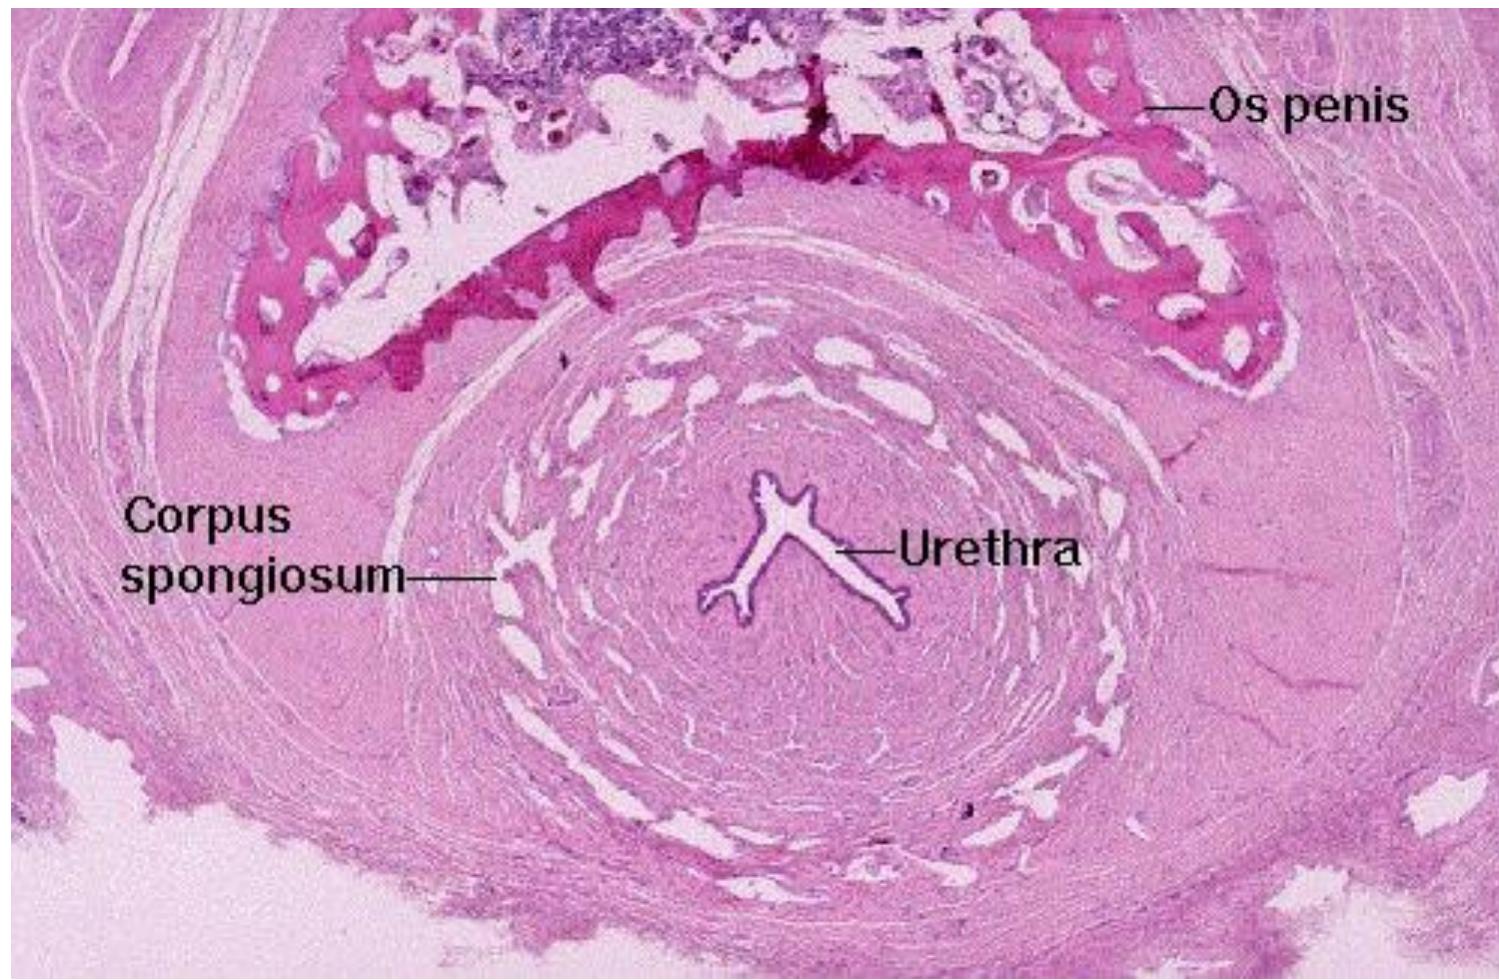

# URETHRA

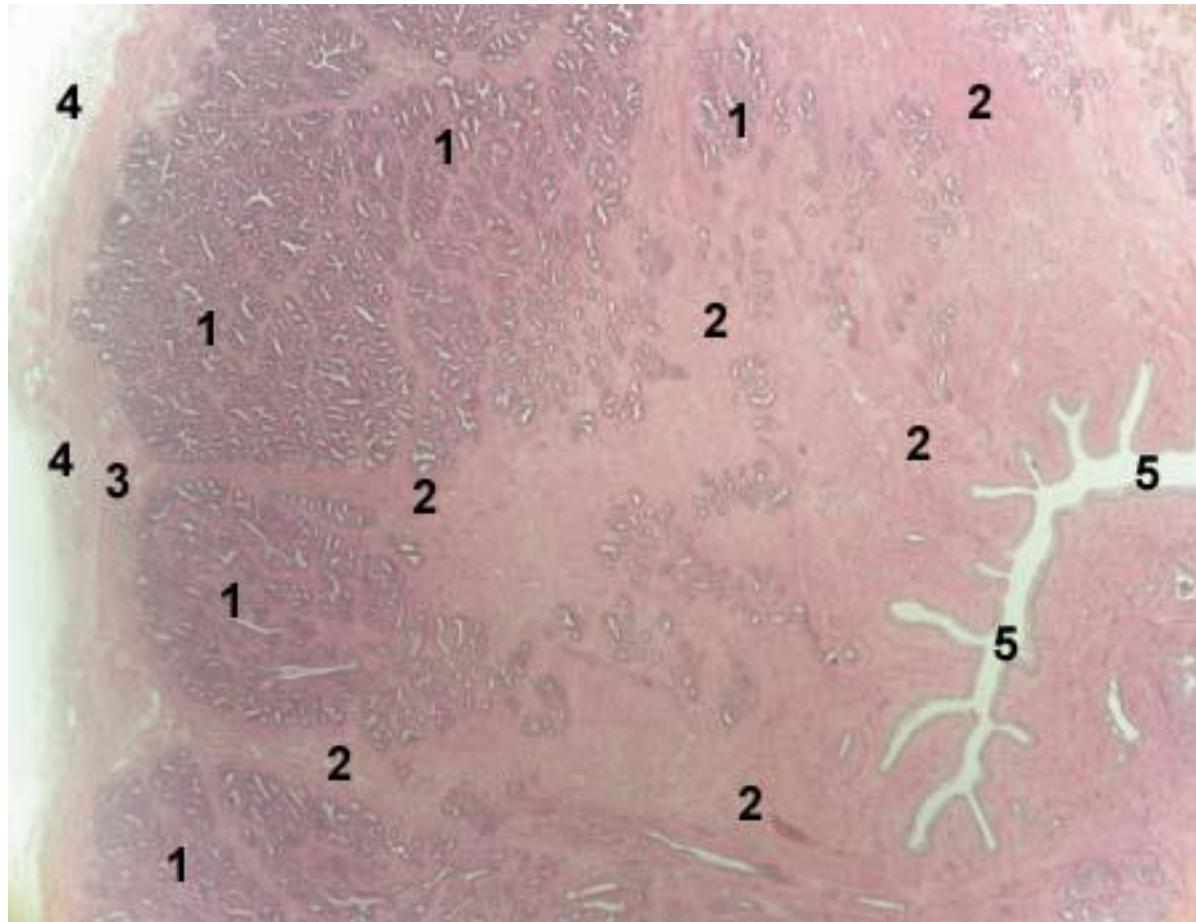

- THREE COATS : muscular , submucous , mucous

# PENILE URETHRA

# PROSTATIC URETHRA
